

What are we measuring?

The rate of patients with timely initial nursing assesment is measured according to specifically designated for each unit and related procedures specified in the first evaluations of nurses

Why is this important?

Nursing process begins with the first evaluation of the patients and continues throughout all stages of treatment and care. In this first evaluation process, initial history of patients which is acquired by the nurses is a very important criterion for maintaining the patient safety and care.

What does our performance tell us?

Results must capture the target. The chart below shows that the AHG's average rate for initial nursing assessment is 96,94. This is the significant achievement in nursing performance.

Formula: $\frac{\text{The number of patients with timely initial nursing assessment}}{\text{The number of medical records reviewed}} \times 100$
